

8. Project Demonstration Phase

- The Project Demonstration Phase is the final stage in which the completed spreadsheet data-import project is presented to an evaluator, teacher, client, or project team. The objective of the demonstration is to show that the implemented Transform Map successfully performs the required data-import operation.

The demonstration should begin with a brief introduction to the project. The presenter can explain the problem of manually entering large amounts of spreadsheet data and introduce the Transform Map as the mechanism used to transfer and transform the data.

- Next, the source spreadsheet should be displayed. The presenter should explain the columns and describe what each row represents. The quality of the source data should also be demonstrated by showing that the spreadsheet has appropriate headers and properly formatted values.

- The next step is to demonstrate the import process. The spreadsheet is uploaded into the system, and the resulting source/import records are displayed. This demonstrates that the spreadsheet information has successfully entered the staging area.

- After this, the Transform Map configuration should be shown. The presenter should explain the source table, target table, field mappings, and any coalesce or transformation rules. For example, the presenter can show how Employee ID from the spreadsheet is mapped to the Employee ID field in the target table.

The transformation process is then executed. The presenter should show the transformation result and verify that the records have been inserted or updated in the target table.

- The demonstration should include a comparison between the original spreadsheet and the final target records. This helps prove that the data has been transferred correctly.

- Testing results should also be explained. The presenter can demonstrate successful import of valid records and explain how duplicate or invalid records are handled. If an error was intentionally tested, the resulting behavior can be shown without affecting important production data.

- Finally, the presenter should summarize the project. The conclusion should explain that the project provides a structured method for importing spreadsheet data through an intermediate import process and Transform Map into a target table. The approach reduces repetitive manual data entry and provides configurable field mapping and transformation capabilities.

- The demonstration therefore serves as the final proof that the project has been designed, developed, tested, and documented successfully. It also gives the evaluator an opportunity to

understand the complete workflow from spreadsheet → import data → Transform Map → target table.
